

E-Commerce Sales Analysis — Summary

For this assignment, I worked with an e-commerce sales dataset and first focused on cleaning and organizing the data. I checked the different sheets for duplicate records, missing values, and formatting issues. I removed duplicate records where required, handled missing values, and corrected the formatting of the data. I also removed the Subcategory column as it was not required for the analysis.

After cleaning the data, I used different Excel formulas to analyze the information. I worked with formulas such as SUM, AVERAGE, IF, COUNTIF, SUMIF, and TEXT to calculate and categorize the data. I also used lookup functions to combine and work with information from different tables.

I then created PivotTables to understand the sales data more clearly. I analyzed sales based on product category, payment type, store type, and month. This helped me understand the overall sales performance and identify different sales patterns.

For visualization, I created Column, Pie, and Line charts based on the analysis. I combined the charts and important sales figures into an E-Commerce Sales Dashboard. I also added slicers and a date timeline to make the dashboard more interactive and easier to explore.

Overall, this assignment helped me understand how Excel can be used for data cleaning, analysis, and visualization. It also gave me practical experience in using formulas, PivotTables, charts, and dashboards to turn raw data into useful business information.
